

LUBO SERGEEV

TOP TIPS FOR CAPTURING MOVEMENT

1. when working with objects that float slowly - capture from the start right to the very end of the movement to ensure you aren't missing a shot - perfect for in the snow or when wind moves through the trees
2. use elements around you to create interesting sculptures - leaves, snow, rain
3. when working with fast moving objects such as fireworks or water, make sure you count and practice timings so you capture the movement at the optimum point
4. you can never take enough pictures! keep snapping to avoid missing a show-stopping action shot
5. when working with floating objects think in many dimensions. leaves, feathers, liquids, etc. are moving in many directions, they can float towards you and towards the horizon. use this as a way to add depth in your photos.
6. follow your object of interest closely no matter if it is a model, tree, ball, or any other moving object and try to predict its next movement through space and be ready to snap it

ABOUT RE CAMERA BY HTC

the company's first ever camera, RE® camera, is a palm-sized camera that turns on when you pick it up.

grab, point and shoot in one movement so seek your creative inspiration in all places and at all times.

**focus on the moment,
not on your camera.**
